Translation of the original Operating Instructions

Hydrostatic Implement Carrier
agria 5900 Cyclone

Before commissioning please read the operating instructions and note the safety and warning information!

Operating Instructions No. 998 432GB-C  07.18

For nameplate see page 4, Fig. A/4
Petrol engine: For engine no. see page 87, fig. C/4
Please provide this information for each spare parts order, to prevent errors in delivery.

Only use genuine Agria spare parts!

The technical data, illustrations and dimensions provided in these operating instructions are non-binding. No claims may be derived from them. We reserve the right to make improvements without amending this manual.

Scope of delivery

(please check):

- Equipment carrier
- Tool kit
- Original Operating Instructions
- Original engine operating instructions
- Machine identity card
  (in envelope on outside of box)

Please complete the machine identity card and return it to Agria-Werke.
Symbols

- Warning symbol, reference to danger point

- Important information

- Fuel

- Choke

- Spark plug connector on

- Engine start

- Engine stop

- Engine speed

- Engine oil level

- Air filter

- Battery

- Clutch

- Wheel drive

- Fast

- Transmission oil level

- Hydraulic steering

- Manual steering

- PTO shaft

- Brake

- Parking brake

- Closed (locked)

- Open (unlocked)

- Turn anti-clockwise

- Turn clockwise

- Visual inspection

- Attachment point for recovery, lashing, towing

- Wear protective gloves

- Fan cooling

- Grease lubrication point

- Maintenance interval

- Before each start-up

- After each cleaning (in particularly with a high-pressure cleaner)

- Annually

- See separate engine operating instructions

- agria-Service - = contact your agria service centre

1 Safety Instructions

Before commissioning, please read the operating instructions and note:

Warning symbol

This symbol has been used throughout these operating instructions to highlight all sections relevant to your safety. Also pass on all safety instructions to other users.

Intended use

The machine meets the current state of the art and complies with the applicable safety regulations at the time of marketing within the context of the approved use. In terms of design it was not possible to eliminate either the foreseeable misuse or the remaining risk without limiting the functionality in accordance with the regulations.

The agria 5900 Cyclone equipment carrier is a manually guided, self-propelled, single-axle machine which powers add-on devices approved in the Agria sales list (based on intended use).

Any other use is considered to be contrary to the intended purpose. The manufacturer is not liable for any damages resulting from such use and the risk is entirely the user’s own.

Intended use also includes observance of the operating, servicing and maintenance conditions stipulated by the manufacturer.

Unauthorized changes to the machine, especially to the safety equipment, may lead to increased levels of danger, which would rule out any manufacturer liability for resulting damage.

When using the machine on public roads – and when being transported – the national road traffic regulations of the relevant country must be complied with (marking, lighting, etc.).

The machine must be operated as directed in the operating instructions. Other operators must given instruction if required.

Any improper use or execution of activities at the machine not described in these instructions constitutes unauthorized misuse and is not within the statutory limits for liability of the manufacturer.

Improper use of the machine can endanger people and may result in damage to the machine or other property of the operator. It can also impair the functionality of the machine.

Reasonable foreseeable misuse

Foreseeable misuse and improper handling include inter alia:

- Removal or manipulation of protective and safety devices
- Use of non-approved add-on devices
- Failure to observe maintenance intervals
- Omitting measurements and tests for the early detection of damage
- Failure to replace wearing parts
- Incorrectly executed maintenance or repair work
- Improper use.
- Working with defective electrical or mechanical devices
- Transport and manoeuvring movements with add-on devices switched on

General safety and accident prevention regulations

Basic rule:

Please observe the relevant accident prevention regulations as well as the generally recognized rules pertaining to
safety, occupational health and traffic laws.

The use of public transportation routes is subject to the Road Traffic Act in its latest version.

Please check the traffic and operating safety of the machine before each commissioning!

The machine may only be used, serviced and repaired by persons who are familiar with it and have been instructed in the hazards involved.

Persons under the age of 16 must not operate the machine!

Only work with good visibility and in good lighting conditions.

Operator clothing must fit tightly. Wear sturdy footwear.

The affixed warning and information signs provide important information for safe operation; please observe them for your own safety!

The engine must be switched off for transport on motor vehicles or trailers outside the working area.

Be careful with rotating tools - keep a safe distance!

Be careful with coasting tools. Before you start working on them, wait until they have come to a complete stop!

There is a risk of crushing and shearing on power-operated parts!

Riding on the implement during operation is not permitted.

Driving behaviour, steering – and possibly – braking capability and tipping behaviour are influenced by attached or suspended devices and loads. Therefore ensure adequate steering and braking capability.

Match the operating speed to the conditions.

Do not adjust the setting of the engine speed governor. A high speed increases the risk of accidents.

Working area and danger zone

The working area is the entire area to be worked on. The user is responsible for third parties in the working area.

Staying in the danger zone of the machine is not permitted (see page 40).

Check the work area before starting and moving. Pay special attention to children and animals.

Foreign objects are to be removed from the area to be worked on prior to starting work. Look out for additional foreign objects while working and remove these promptly.

For operation in enclosed areas, ensure that a safety distance is kept from edges to prevent damage to tools.

Operation and protective devices

Before you start work

Familiarize yourself with the equipment and operating elements and their functions. Above all, learn how to turn the engine off quickly and safely in an emergency!

Ensure that all protective devices are mounted and properly adjusted!

If no add-on device is attached, the PTO shaft must be switched off and covered with the protective cap.

Suitable shoes must be worn depending on the type of ground surface (vegetation, humidity ...), so that the operator does not slip or fall.

Startup

Do not start the engine in closed rooms, the exhaust fumes contain carbon monoxide, which is very toxic if inhaled!

Before starting the engine, set all operating elements to neutral or idle position.

Do not step in front of the machine or the add-on device to start the engine.
1 Safety Instructions

Do not use assist-starting liquids when using electrical assist-starting devices (jumper cable). Danger of explosion!

Operation

Never leave the operator's position at the steering bar while working.

Never adjust operator bars while work is in progress – risk of accident!

For all work with the device, especially when turning, the machine operator must maintain the distance from the device shown by the bars.

Riding on the implement during operation or in transport is not permitted.

In the event of any clogging to the work equipment or add-on device, the engine must be stopped and the work equipment or add-on device must be cleaned with appropriate tools. There may be tension in the drive train as a result of the blockage, which is why you should resolve the blockage carefully.

In the event of any damage to the machine or the add-on device, shut down the engine immediately and have the damage repaired.

In the event of any malfunctions to the steering, stop and park the machine immediately. Have the fault resolved without delay.

If there is a risk of skidding down on sloping terrain, then the machine must be held by an attendant using a bar or a rope. The attendant must be located above the machine at a safe distance from the work equipment.

Work across the slope along contour lines if possible. If possible, turn the machine in uphill direction.

Finishing work

Never leave the machine unsupervised while the engine is running.

Switch the engine off before leaving the machine. Then close the fuel tap(s) (if present).

Protect the machine against unauthorized use. In ignition key models, remove the ignition key; otherwise, remove the spark plug connector.

Implements

Attach an implement only when engine and implement drive are switched off.

Prior to attaching and starting the implement, read and observe the operating instructions of the implement.

Use adequate tools and wear gloves to replace implements and parts thereof.

Put the supporting equipment to the proper position and ensure stability when you attach or remove an implement.

Secure machine and implements against rolling away (parking brake - if installed, wheel chocks).

There is a risk of injuries when you attach an implement. Take special care.

Attach an implement in accordance with the regulations and only at the specified fixtures.

Always switch off the working tools during a transport ride or when you drive to adjacent working areas.

Secure machine and implement against unauthorized use and rolling away when you leave it. If necessary, install transport or safety equipment, and put it in protective position.

Mowing equipment

When handled improperly, the sharp edges of the mower knives can cause significant injuries. Always wear protective gloves when you work on the knives.

Ensure that the screwing movements are away from the cutting edges when you replace a knife and loosen or secure the knife driver.

Wear protective goggles and protective gloves when you grind the knives.
1 Safety Instructions

Ballast
Always attach ballast properly at the attachment points provided.

Maintenance and cleaning
Only trained specialist personnel, who can carry out professional maintenance and repair, may carry out this work.
Do not carry out maintenance and cleaning with the engine running.
When working on the engine always remove the ignition key (if present) and also the spark plug connector in the case of petrol engines.
Protective devices and tools that are subject to wear and tear must be regularly inspected and replaced if necessary!
Damaged cutting tools must be replaced!
When replacing cutting tools use suitable tools and protective gloves.
Do not carry out repair work such as welding, grinding, drilling, etc. on structural, safety-relevant parts (such as steering bar, tractor hitches, etc.)!
Disconnect the battery before commencing welding work.
During welding work, make sure that the electrical and electronic components of the machines are not influenced.
Keep the machine and attachments clean, to avoid the risk of fire.
Regularly check nuts and bolts for tightness and retighten if necessary.
After maintenance and cleaning, ensure that the protective devices are reinstalled and properly adjusted!
Only use genuine Agria spare parts.
Carry out a functional and safety test after completing the work.

Storage
Never store the machine in rooms with open heating.
Do not park the machine in closed rooms with fuel left in the tank. Fuel vapours are hazardous.

Engine, fuel and oil
Do not run the engine in a closed room. There is a high risk of poisoning! Therefore always replace damaged exhaust parts.
Handle hot engine components with caution!
The silencer and other engine parts get very hot when the engine is running and are still hot directly after the engine is switched off. Keep a sufficient distance from hot surfaces and keep children away from the running engine.
Caution is needed when handling fuel. These is an increased risk of fire. Never handle fuel near open flames, ignitable sparks or hot engine parts.
Do not refuel in closed rooms. No smoking when refuelling!
Refuel only with the engine switched off and cooled down.
Do not spill fuel. Use a suitable filling device.
If you spilled fuel, push the machine away from the spilled liquid before you start the engine.
Make sure fuel is of the specified quality.
Store fuel in approved containers only.
Drain fuel only outdoors and into suitable containers.
In the interests of safety, replace the fuel tank cap and other tank caps if damaged.
Store anti-corrosion agents and stabilizer fluids out of the reach of children. If sickness and vomiting occur, consult a doctor immediately. In the event of con-
tact with the eyes rinse immediately with plenty of water. Avoid inhaling vapours. Read and observe enclosed instructions! Before disposing of opened and seemingly empty pressurized tins make sure they are completely empty. Empty them in a well-ventilated area safe from sparks and flames. Dispose of tins as hazardous waste if necessary.

When working with oil, fuel and grease wear suitable protective gloves and use skin protection agents if necessary.

Be careful when draining hot oil, danger of burns.

Make sure the oil used is of the specified quality. Store in approved containers only.

Dispose of oil, fuel, grease and filters separately and properly.

**Hydraulic system**

The hydraulic system is at high pressure.

Ensure that the hydraulic hoses are connected correctly when you connect hydraulic components.

⚠️ High-pressure hydraulic oil can penetrate your skin and cause severe injuries. Danger to life!

See a doctor immediately when you are hurt. Risk of infection!

Prior to working on the hydraulic system depressurize it and switch off the engine (specialized workshop).

To avoid injuries, use suitable devices when you try to locate leaks (specialized workshop).

Check hydraulic hose lines at regular intervals for leaks and ageing. Replace them as necessary. Always replace them after the specified intervals at the latest.

Only use genuine Agria hydraulic hoses.

**Tyres and tyre pressure**

When you work on the wheels ensure that the machine is parked securely and is secured against rolling away.

Only skilled specialists are allowed to repair tyres, using suitable installation tools.

Check the tyre pressure at regular intervals. There is a risk of explosion from excessive tyre pressure.

Observe the required tyre pressure when you use ballast.

During each service work, tighten the drive wheel bolts and nuts and check the tightening torque.

**Electrical system and battery**

Persons with cardiac pacemakers are not allowed to touch the energized parts of the ignition system as long as the engine is running.

When working on the electrical system always disconnect the battery (negative terminal).

Ensure that the battery is connected correctly - first the positive terminal and then the negative terminal! Reverse the sequence when disconnecting!

Be careful with battery gases - risk of explosion!

Avoid sparks and naked flames in the vicinity of batteries.

Remove the plastic cover (if installed) before you recharge a battery. This avoids the accumulation of highly explosive gases!

Caution when handling battery acid - caustic!

Only use specified fuses. If the rating of the fuses used is too high, the electrical system may be irreparably damaged - danger of fire!

Always cover the positive terminal with the specified cover or terminal cap.
Description of the warning, prohibition and mandatory signs

Prior to starting up the machine, read and observe the operating instructions and safety instructions.
Prior to starting cleaning, maintenance or repair work, switch off the engine and pull the sparking-plug connector. Remove the ignition key if there is one.

Caution - risk of fire
- Refuel only with the engine switched off and cooled down.
- No naked flame.

The engine exhausts contain poisonous gas
- Keep your distance.
Never run the engine in a closed room.

**Handle hot engine components with caution!**
Keep sufficient distance to hot surfaces.

Keep a safe distance to the mower knives when the engine is running!

When working with the machine wear individual hearing protection.

Wear sturdy footwear.

Check the engine oil level at least every 8 operating hours.

  Electrode gap: 0.76 mm
**Ignition:** ................................................................. Electronic magneto ignition, contactless, fixed ignition point, radio-interference-suppressed to VDE 0879
**Valve play:** (with cold engine) ....................................... Inlet and outlet 0.13 ... 0.18 mm
**Starting device:** ............................................................ Electric starter
**Generator:** ....................................................................... 12 V 16 A
**Battery:** ......................................................................... 12 V 18 Ah
  Blade fuse 15 A
**Fuel:** ............................................................................... Commercially available car petrol, octane rating see engine operating instructions
**Fuel consumption:** .......................................................... 312 g/kWh
**Capacity of the fuel tank:** ................................................. approximately 6.6 l
**Air filter:** ........................................................................ Dry filter cartridge with foam prefiltre
**Carburettor:** ..................................................................... Horizontal float carburettor
**Nominal speed:** .............................................................. 3600 rpm
**Upper no-load speed:** ....................................................... 3800 rpm
**Idle speed:** ................................................................. 1850
**Engine oil:** ................................................................. Multigrade oil, filling volume approximately 1.1 l
  at ambient temperature -15 ... +45 °C: SAE 10W-40 API-SF, SG or higher
  at ambient temperature -25 ... +15 °C: SAE 5W-20 API-SF, SG or higher
**Noise values:** .................................................................. See page 23
**Vibrational acceleration value:** .......................................... See page 23
**Slope capability:**
The engine is suitable for use on slopes (with "max." engine oil level = upper filling mark):
Continuous operation up to inclination of 45° (100 %)
Petrol engine 22 hp

Engine: .............................................................................................................. Briggs & Stratton
Type: .............................................................................................................. Vanguard 22 hp 386447-0181
Design: Forced air-cooled 2-cylinder, four-stroke engine (petrol) overhead valves
Bore x stroke: ............................................................................................... 75.5 x 70.0 mm
Displacement: ................................................................................................. 627 cc
Power: ........................................................................................................ 16.4 kW (22 hp) at 3600 rpm
Torque: ........................................................................................................ 46.3 Nm at 2700 rpm
Spark plug: Bosch FR8DC, Champion RC12YC
Electrode gap: 0.76 mm
Ignition: Electronic magneto ignition, contactless, air gap 0.2 ... 0.3 mm, radio-interference-suppressed to VDE 0879
Valve play: (with cold engine) Inlet and outlet 0.10 ... 0.15 mm
Starting device: Electric starter
Generator: 12 V 192 W
Battery: 12 V 18 Ah
Fuel: Commercially available car petrol, octane rating see engine operating instructions
Fuel consumption: 312 g/kWh
Capacity of the fuel tank: Approximately 8.5 l
Fuel filter: fuel-inline
Air filter: Cyclone filter
Carburettor: Horizontal float carburettor
Nominal speed: 3600 rpm
Upper no-load speed: 4000 rpm
Idle speed: 1400 rpm
Engine oil: Multigrade oil, filling volume approximately 1.7 l at ambient temperature -15 ... +45 °C: SAE 10W-40 API- SF, SG or higher at ambient temperature -25 ... +15 °C: SAE 5W-20 API- SF, SG or higher
Lubrication system: Pressurized oil circulatory lubrication
Oil pressure at idle speed: min. 0.35 bars
Oil filter: Screwed filter cartridge
Noise values: See page 23
Vibrational acceleration value: See page 23
Slope capability:
The engine is suitable for use on slopes (with "max." engine oil level = upper filling mark): Continuous operation up to inclination of 45° (100 %)

---

Hydrostatic Implement Carrier **agria 5900 Cyclone**
3 Devices and Operating Elements

The device carrier agria 5900 Cyclone is a base motor unit that is always used together with an implement. It is thus suitable for use in municipalities, agriculture and forestry, and in winter service.

When the machine is used on public roads – also during transport movements, for example – ensure that the national road traffic regulations are observed (marking, lighting, etc.).

Engine

The four-stoke petrol engine is to be used with standard petrol (see chapter Startup, page 38).

During the first 20 hours of operation (running-in period) do not use the engine at full power.

The rule of never using the engine at a higher speed than necessary for the work in hand applies even after the running-in period.

High speeds are detrimental to all engines and significantly reduce their service life. This especially applies for no-load operation! Overrevving the engine (letting it roar) can result in immediate damage.

Cooling

The engine is cooled with an air blower. Keep the fan grille at the cable-pull starter and the cooling fins of the cylinder free of dirt and aspirated plant debris.

Idling

Always ensure that the engine idle speed is adjusted correctly. With speed regulating lever at idling, the engine should continue running smoothly.

Air filter

The air filter cleans the aspirated air. A contaminated filter reduces the engine output.

Ignition system

The petrol engine is equipped with a contactless electronic ignition system. We recommend that any necessary inspections are carried out by a skilled person only.

The implements released in the Agria sales list are available.
Speed regulating lever

Use the speed regulating lever (B/9) on the steering bar to continuously adjust the engine speed between min = IDLE and max = FULL THROTTLE as required.

Safety circuit

Stop position:
When you release the safety lever (B/4), the traction drive is set to NEUTRAL and the PTO shaft is switched off. The traction drive stops at once! The engine continues running!

Operating position:
Press down the safety lever (B/4) during operation.

Never tamper with the safety circuit. Never tie up the safety lever.

The safety lever is used as an emergency off switch: Release the lever in a dangerous situation. It swings automatically to "STOP" position!
- The traction drive stops at once
- The PTO shaft is switched off automatically
- The engine continues running.
Ignition lock

The ignition lock (B/12) for the electrical starter has 3 switching positions:

- **O** = Engine OFF
  - LED lamps OFF

- **I** = Operating position
  - Whenever the unit is switched on, the easy-control circuit is automatically set to NEUTRAL
  - LED lamps ON

- **C** = Engine start position
  - Ignition key returns automatically to operating position "I"

Warning signal

The warning signal sounds when the ignition key is turned to position "I" while the engine is stopped. The signal stops as soon as the engine is running and the generator charges the battery.

The warning signal stops also when you return the ignition key to position "O", or when you remove the key.

- The battery is discharged when the ignition is switched on for a longer time without the engine running.

If the warning signal sounds while the engine is running:

- There is something wrong with the generator charging the battery - agria-Service -
- Or the engine oil pressure is not OK (only with 22 hp)
  - Check the engine oil level immediately.
  - Top up engine oil if necessary.
  - If the engine oil level is OK:
    - agria-Service -

- Do not turn the ignition switch to "O" position while the engine is running. This can cause a defect in the voltage regulator!
Clutch

The clutch is operated at the manual clutch lever (B/5).

When you pull the manual clutch lever to position "O":
- The traction drive stops at once and returns to NEUTRAL position
- The PTO shaft is disengaged
- The engine continues running

- Observe the clutch play to prevent the clutch from slipping during work. See page 65.

> Do not park the machine for too long a time with disengaged clutch while the engine is running. This can damage the clutch release bearing.

When the motor is stopped, park the machine only with pulled hand lever (stop pawl engaged). Failure to do so can lead to corrosion, resulting in clutch problems.

PTO shaft shifting

To actuate PTO shaft shifting, position the bar in the centre position.

The gear-independent PTO shaft (A/22) is switched on with the shifting rod (B/7). To switch it on, press down the safety lever (B/4) and move the manual clutch lever (B/5) to "O".

Shifting rod is pulled rearwards, the PTO shaft drive is switched on.

Merely release the safety lever (B/4) to switch off the PTO shaft.
Gearbox

The agria 5900 Cyclone machine is equipped with a hydrostatic traction drive.

easy-control drive control

Using the electrical operating unit at the right steering bar and an electronic control unit, you can change the driving speed forward and backward via an electrical servo-motor.

- agria-Service -
Pushing operation

- Pushing the machine without engine propulsion requires the idling loop to be opened (position "O"). **Caution: There is no hydraulic braking effect in idling position.**
- The idling loop (A/3) sits at the front right underneath the hood. Rotate the shift lever to switch it.
- Hydraulic drive is resumed when the idling loop is closed (position "O").
- Check the switching position before you start work!

Pushing operation / towing up to max. 4 km/h. 
Tow-start is not permitted!

Hydraulic steering

Hydraulic steering reduces the speed of the inside wheel down to stop, the outside wheel maintains its speed.

Steering

- The steering movement at the steering bar activates the hydraulic steering when the engine is running.
- Steers only when the machine is moving, not when it is stopped.
- Hydraulic steering is faster as you increase the steering movement.
Disabling hydraulic steering
Pull and turn the handle of the shifting cable (B/8) to lock hydraulic steering. Steering the machine will then be heavy.
Hydraulic steering is activated when you release the lock.
Utilization: Basically the same effect as a differential lock.

Service and parking brake
The combined service and parking brake is used for braking and parking the machine on hilly grounds.

Service brake
- Swing the eccentric lever (B/2) up and to the rear - both driving wheels are braked. The eccentric lever swings back to its home position when you release it - the brake is released.

Parking brake
- Swing the eccentric lever (B/2) up and to the rear beyond the dead point. The eccentric lever stops automatically - both driving wheels are blocked.

To open the parking brake, swing the eccentric lever back to the initial position - the brake is released.

Never drive and brake at the same time.
Before you start moving the machine, ensure that the brake is released. Failure to do so can cause damage due to overpressure (failure of wheel motor).

Steering bar

Adjust the steering bar only when traction drive and PTO drive are switched off - risk of accident!
Steering bar height adjustment

- Press the clamping levers A at both sides until the notches B are released.
- Move the left and the right steering bar to the required height and allow it to engage in the corresponding notch.
- Tighten the clamping levers A.

Lateral steering bar adjustment

From its normal position (centre position), you can swing the steering bar through approximately 30 to the left / right.

- Pull up and hold the T-handle (B/1). Swing the steering bar to the left or right to the required position.
- Release the T-handle and move the steering bar slightly to the left or right until the locking pin engages.

Loading strap

The loading strap (A/7) is provided to load the machine and to attach the retaining rope when you work on a slope. Open the hood.

Check the loading strap for damage. Replace it if necessary!
Do not use sharp-edged load carrying equipment (e.g. sharp-edged hooks, eyes etc.)!

Never walk or stand under suspended loads. Danger to life!
Attachment points

Always use the lashing points for towing, recovery, securing for safe transport and loading the machine. (= eyelets at connection flange and engine protection plate).

Lashing to other points can cause damage.

Supporting foot

Fold down the supporting foot (A/29) to park the machine, in particular without implement.
Fold up the supporting foot to move the machine and for work.

Driving wheels

Install the wheels such that the tip of the tyre pattern points in driving direction (seen from above). This provides full traction power. Install the spring washers such that their spherical side points towards the counterbore in the disc wheel (see Fig. Wheel mounting bolts on page 33).
The wheels can be mounted inward or outward (wide / narrow track), so that the required wheel track can be obtained (see track width table on page 20).

</tr>
</tbody>
</table>

Driving wheels for hillside positions

For work at extreme hillside positions we recommend twin tyres or grab wheels.

Wheel mounting bolts

Version A wheel bolt with spring washer
Version B stud bolt with spring washer and wheel nut
- Firmly screw the short thread of the stud bolt into the wheel hub. If possible, use LOC-TITE 270 (or a similar product) to secure it.
- Install the spring washer such that its spherical side (centring) points towards the disc wheel!

On a new machine and after each wheel change, tighten the wheel bolts or wheel nuts after the first 2 operating hours with 100 Nm, and always during maintenance work.

To avoid damage to the brake system:
- ALWAYS use spring washers with spherical side.
- Use ONLY original length of the bolts.

Snow chains

Observe the manufacturer's instructions when you use snow chains. Ensure that there is enough clearance at the machine components.
Wheel track enlargement

- Part 5519 031 to attach the Terra driving wheels 21x11.00-8 TG.

<p>| | | | |</p>

<td>Spring washer (spherical)</td>
</tr>
<tr>
<td>11</td>
<td>Wheel bolt</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Hood

Open hood
Fold hood forward.

Gantry axle adjustment

To improve the weight distribution when heavy implements are attached, you can relocate the axle to the front.

- To do this, relocate the complete wheel motors (1). Install them as shown in the front flange pattern (2).
- Clean the flange pattern first.
- Never release any hydraulic lines or Bowden cables!
- Tighten the fastening screws (3) with 45 Nm.
Continuous gantry axle adjustment (option part 5939 011).

1. Pull the parking brake (B/2)

2. Release the handle

3. Hold the steering bar to pull the machine rearwards or to push it forward

4. Tighten the handle

5. The handle must not point downward

- While you are turning the handle upwards, pull it axially from the outside until it is disengaged
3 Devices and Operating Elements

Installing and removing implements

⚠️ Ensure that the engine is switched off!

Prior to attaching and starting the implement, read and observe the operating instructions of the implement.

Attachment:

- The contact surfaces of machine and implement must be clean.

1. In a PTO-driven unit: Set the shift lever (4) at the implement to "O".

2. Insert the machine with the arrestor pins (2) from below into the arrestor hooks (3) of the implement.

3. Fold both eyebolts (1) over the connecting flange.

Attention:

- Is the flange centring (5) correct?
- Are the flange surface plane on each other?
- Tighten the cap nuts uniformly.

4. In a PTO-driven unit: Set the shift lever (4) at the implement to "I", allow the strip spring shift lock (6) to engage (if installed) - shifting is at the base machine.

Removal in reverse sequence.
LED lamps

The LED lamps (3 watts each) in the hood are switched on/off automatically with the ignition switch.
The LED lamps can not be switched off manually when the ignition is switched on.

Battery

The battery of a new machine is not dry pre-charged. It must be charged fully after it has been filled with battery acid (charging current = 1/10 of the battery capacity).

See leaflet of the battery manufacturer!
See page 58.

Fuses

Fuses protect voltage regulator and generator against short-circuit from the outside.

- Blade fuse (C/35) 15 A
  = for voltage regulator and generator
- Blade fuse (A/5) 4 A
  = for control module

Open the fuse holder to replace a defective fuse.
- Ensure that you have a spare fuse on stock.
4 Commissioning and Operation

Commissioning

Please note that the engine’s service life and operational reliability are heavily dependent on the running-in time. Always allow a cold engine to warm up for a few minutes first of all and do not run up to full power immediately.

During the first 20 hours of operation (running-in period) do not use the engine at full power.

⚠️ Attention: The engine is not filled up with engine oil for transport reasons!

Fill the engine with engine oil before first commissioning, but do not go beyond the maximum level!

⇒ Engine operating instructions

Prior to startup, check the gearbox oil level. See page 59.

⚠️ Charge the battery - the electrical adjustment of the hydraulic pump and the safety valve do not work without a charged battery.

See page 58.

This engine runs smoothly with conventional unleaded regular and premium petrol (also E10) as well as Super plus.

Do not add oil to petrol.

Only use fresh, clean fuel (no older than 3 months) and only use approved fuel cans available from specialist dealers. Do not use rusted metal cans or plastic containers which are not fuel-resistant.
4 Commissioning and Operation

Always consider for good care of the filter and clean fuel. Use only branded petrol.

Caution is needed when handling fuel.

Petrol is highly flammable and explosive under certain conditions!

Do not refuel in closed rooms.

Refuel only with the engine switched off and cooled down.

Never refuel near naked flames, ignitable sparks or hot engine parts.

No smoking when refuelling!

Do not spill fuel. Use a suitable filling device.

Do not fill the fuel tank until it overflows. Leave approximately 5 mm space to allow the fuel to expand.

If you spilled fuel, push the machine away from the spilled liquid before you start the engine.
Danger zone

Observe the operating instructions of the implements and the safety instructions.

Staying in the danger zone of the machine during startup and operation is not permitted.

If the operator notices that people or animals are in the working area, the machine must be switched off immediately and not restarted until this area is clear.

The user is responsible for third parties in the working area (entire area to be worked on).

The hazard zone differs with the installed implement (A) (for work and transport drive):

Transport ride with * only 3 m
Before starting the engine

- Actuate the parking brake (B/2)
- Sufficient fuel in the tank?
- Air filter clean?
  ➤ and/or page 55
- Check engine oil level
  ➤ or page 50 and/or page 53
- Checking the gearbox oil level
  See page 59
- Checking all nuts and bolts for tightness
- Plug on the sparking-plug connector

⚠ Only put the machine into operation after all protective devices have been mounted, are functional and in protection position.

⚠ Never start or allow the engine to run in enclosed rooms or rooms that are not ventilated.

It is essential to ensure for sufficient ventilation and a quick extraction of the exhaust fumes. The exhaust fumes contain carbon monoxide that is highly toxic when inhaled.
Starting the petrol engine

1. Depending on the version, open one or both fuel cock(s) (C/13)

2. **Cold** engine: Set CHOKE actuator (C/20) to "CHOKE". Reset CHOKE when the engine is hot

   Engine at operating temperature: Leave CHOKE in normal operating position

3. Set speed regulating lever (B/9) to approximately 1/3 throttle

4. Insert the ignition key into the ignition lock (B/12) and turn it clockwise to position "I" - even if you start the engine with cable-pull starter
   - The warning signal sounds

5. Start the engine from outside the hazard zone:
   - Continue turning the ignition key clockwise to "START" position

   As soon as the engine starts, release the ignition key. The key returns automatically to position "I", and the warning signal disappears.

   If the engine does not start, turn the ignition key back to position "O" before you try again to start (start repetition lock).
   - Or manual start with cable-pull starter

**Tow-start is not permitted!**

6. Once the engine is running, allow the engine to warm up for a short time. Slowly move the choke actuator back to operating position (if actuated).

Handle hot engine components with caution!

The silencer and other engine parts get very hot when the engine is running and are still hot directly after the engine is switched off. Keep a sufficient distance from hot surfaces and keep children away from the running engine.

⚠️ **When the petrol engine is running, do**
not touch or remove the ignition cable or spark plug connector.

**Stopping the petrol engine**

<table>
<thead>
<tr>
<th><img src="parking_brake.png" alt="Parking Brake" /></th>
<th>Actuate the parking brake (B/2)</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="30Sec.png" alt="30 sec" /></td>
<td>Set the speed regulating lever to idle position, and allow the engine to idle (min.) for approximately 30 seconds</td>
</tr>
<tr>
<td><img src="ignition_key.png" alt="Ignition Key" /></td>
<td>Turn the ignition key back to position &quot;O&quot;</td>
</tr>
<tr>
<td><img src="fuel_cock.png" alt="Close Fuel Cock" /></td>
<td>- The warning signal disappears</td>
</tr>
<tr>
<td><img src="secure_machine.png" alt="Secure Machine" /></td>
<td>Close the fuel cock(s)</td>
</tr>
</tbody>
</table>

**Secure the machine against unauthorized use and rolling away**

- Remove the ignition key
- Use wheel chocks

**If you want to shut down the machine for a longer time, do not stop the engine at the engine stop switch. Close the fuel cock(s) and let the engine run until it stops. This empties the carburettor and prevents resinification.**

When the warning signal sounds, turn the ignition key back to "O", and remove it.
Working

⚠️ Check the function of the safety circuit. See page 63.
- Start the machine only when the safety circuit is working!

Start the engine as described at "Starting the engine". See page 41

Wear hearing protection and solid shoes.

Open the parking brake (B/2)

When working with PTO-driven devices:
Press down the safety lever (B/4),
Move the manual clutch lever (B/5) to position "O"
and engage the PTO shaft with the shifting rod (B/7).

Slightly pull at the manual clutch lever (B/5),
disengage the stop pawl (B/6) and
release it slowly while you are opening the throttle.

⚠️ Engage carefully. The exact neutral position of the hydraulic drive can not always be reached - the device may start moving immediately.

At the rocker switch (B/15), select driving direction and driving speed as required by circumstances and demand

- **Traction drive neutral position** see page 28
- **Actuation of safety circuit** see page 25

**Changing the driving direction**
Description of the easy-control drive control see page 28
- Actuate the rocker switch (B/15) accordingly

**Turning**
• Press the turning assistant momentary switch (B/14) and perform the steering movements at the steering bar.

- The machine reduces the driving speed. The driving direction is reversed and the machine turns as it is guided by the steering movements.

⚠️ In particular when reversing or manoeuvring, watch out for obstacles to prevent surprises!

⚠️ Always switch off the working tools during a transport ride or when you drive to adjacent working areas.

Handle hot engine components with caution!
The silencer and other engine parts get very hot when the engine is running and are still hot directly after the engine is switched off. Keep a sufficient distance from hot surfaces and keep children away from the running engine.

⚠️ Never leave the machine unattended while the engine is running.

If you have to clean the machine during work, switch off the engine and remove sparking-plug connector(s) and ignition key for safety reasons.
Working on slopes

Slope capability
Petrol engine 13 hp: $\alpha_{\text{max}} = 45^\circ$, see page 21
Petrol engine 22 hp: $\alpha_{\text{max}} = 45^\circ$, see page 22

Observe the operating instructions of the implements and the safety instructions.

⚠️ Depending on the type of ground surface (vegetation, humidity ...), wear suitable shoes so that you do not slip or fall.

If there is a risk of slipping on a slope, have a second person who holds the machine with a bar or a rope. The second person must stand above the machine at a safe distance from the hazard zone.

Work across the slope along contour lines if possible. If possible, turn the machine in uphill direction.

Starting the engine on a slope
Use the following procedure if you have to restart a stalled engine:

- Actuate the parking brake
- Set clutch and safety circuit to "Start position"
- Restart the engine
Notes on mowing/mulching

When mowing/mulching, only work uphill to clear the headland.

Never work downhill. The machine could start slipping. Never try to stop a slipping machine. The machine is too heavy. You can not hold it. If possible, steer the machine across the slope. Release the safety lever to activate the safety circuit.

At the end of the mowing work or in case of plugging:

- Switch the traction drive to idle. The machine stops while the knives continue moving. This removes the debris from the mowing system.
- Switch off the PTO shaft drive
- Switch off the engine
- Install the knife protection bar
Safety instructions for handling

- Never let the engine run in a closed room. Dangerous carbon monoxide can accumulate.
- Always wear safety shoes and long trousers during the work. Never operate the machine when you are barefooted or in sandals.
- Check the complete terrain on which you want to use the machine. Remove all objects that could be ejected by the machine.
- Always work during daylight or with good lighting.
- Always ensure a secure position on a slope.
- Guide the machine only at walking speed.
- Work across the slope, never uphill or downhill.
- Be particularly careful when you change the driving direction on the hill.
- Never work on excessively steep slopes.
- Be particularly careful when you turn the machine or pull it towards yourself.
- When hoeing or tilling difficult soil (stony, hard), there can be jerky movements of the machine to the front and upwards. Be particularly careful.
- Always switch off the working tools during a transport ride or when you drive to adjacent working areas.
- Never change the basic setting of the engine. Never allow the engine to overspeed.
- Carefully start the engine in accordance with the manufacturer's instructions. Ensure that your feet are at a safe distance from the tools.
- Never approach your hands or feet to rotating parts.
- Never lift or carry the machine while the engine is running.
- Switch off the engine: - when you leave the machine; - before you re-fuel.
- Close the fuel cock(s) after work.
- Never store the machine with petrol in the tank inside a building if petrol vapours could get into contact with naked flames or sparks, or ignite.
- Empty a tank only outdoors.
- Allow the engine to cool down before you store the machine in a closed room.
- For safety reasons, replace worn-out or damaged parts.
5 Maintenance and Repair

As well as observing the operating instructions valid for the machine, it is equally important to pay due attention to the following instructions on care and maintenance.

Larger maintenance and repair tasks may only be carried out by trained specialists who can carry out professional maintenance and repair.

You should only undertake smaller maintenance and repair tasks yourself if you have the relevant tools and training for machinery and combustion engines.

Only use genuine Agria spare parts.

Carry out a functional and safety test after completing the work.

Lubricants and anti-corrosive agents

Use the lubricants specified for engine and gearbox (see "Technical data").

For "open" lubricating points or nipple lubricating points we recommend bio lubricating oil or bio lubricating grease (as specified in the operating instructions).

We recommend using bio-anti-corrosive oil to preserve machines and attachments (do not apply on painted covers). The oil can be brushed or sprayed on.

Bio-lubricants and bio-anti-corrosive agents are environmentally friendly, as they are quickly biodegradable.

By using bio-lubricants and bio-slushing oil you act environmentally responsible, protecting the environment and promoting the well-being of humans, animals and plants.

Always switch off the engine before you start any maintenance or repair work!

Additionally remove the sparking-plug connector of a petrol engine!

Wear protective gloves when you work on the mowing and tilling tools!

When working with oil, fuel and grease, wear suitable protective gloves and use skin care products if necessary.

Handle hot engine components with caution!
Petrol engine 13 hp

Check engine oil level

Before each start-up and after every 8 hours of operation

- Only with the engine switched off and on level ground.

- Clean the oil filler plug and its environment.

- Unscrew the oil filler plug, wipe the oil dipstick with a clean cloth and reinsert it (do not screw it in). Remove the oil dipstick and check the oil level.

- If the oil level is below the lower "min" mark, fill in engine oil (see "Technical data") up to the rim of the oil filler neck "max".
Change engine oil

For the first time after 5 operating hours, then after every 50 operating hours or Annually (depending on which occurs first). At heavy duty or high ambient temperature, change the oil already after 25 operating hours. Change the oil when the engine is still warm, but not hot - danger of burns!

- Clean oil filler plug / oil dipstick, oil drain plug and their environment.
- Open oil filler plug and oil drain plug, collect the used oil in a suitable container. Alternatively, you can use a drain pump to suck the used oil through the filling hole.
- Ensure proper disposal of the used oil.

Check the sealing rings. Replace if necessary. Tighten the oil drain plug!

Oil filling volume and quality see "Technical data".
- If possible, use a funnel or a similar fixture to fill in the oil.

Air cooling system

After long periods of operation the cooling system can be obstructed with dust or plant particles. Continuous operation with an obstructed cooling system causes the engine to overheat and can damage the engine.

Never spray water on the engine. Use a brush or compressed air.

- Continually check the fan grille (C/5), and remove aspirated dirt and plant debris.
- Remove the fan housing after every 100 operating hours or at least yearly, ideally before the season. Clean the cooling fins on cylinder and cylinder head, and the deflector plates and the fan wheel that are necessary for air circulation.

-agria-Service-
Exhaust system and speed governor

Regularly check the exhaust system (C/18), governor lever, linkage and governor springs for soiling and plant debris and clean with a brush or compressed air if necessary. **Danger of fire - due to dirty exhaust system!**

Check before each start-up.

Replace damaged exhaust parts.

**Handle hot engine components with caution!**

The silencer and other engine parts get very hot when the engine is running and are still hot directly after the engine is switched off. Keep a sufficient distance from hot surfaces and keep children away from the running engine.

**Idle speed**

Always ensure that the engine idle speed is adjusted correctly. With speed regulating lever at idling, the engine should continue running smoothly.

- agria-Service -

**All further maintenance and care of the engine**

[Engine operating instructions]
Petrol engine 22 hp

Check engine oil level

Before each start-up and after every 8 hours of operation

- Only with the engine switched off and on level ground.

- Clean the oil dipstick (C/7) and its environment.

- Remove the oil dipstick, wipe it with a clean cloth and reinsert it. Remove the oil dipstick and check the oil level.

- If the oil level is below the lower "min" mark, fill in engine oil (see "Technical data") up to the "max" mark.

Change engine oil

First after 8 operating hours, then after every 50 operating hours or Annually (whatever is first). The engine must still be warm, but not hot - risk of burning!

- Clean oil filler plug (C/2), oil drain plug and their environment.

- Change the oil. Dispose of the used oil properly.

Tighten lid and oil drain plug!
Oil filing volume and quality see "Technical data".
Changing the engine oil filter

Change the oil filter (C/8) after every 100 operating hours or after each season, whatever occurs first.

- Prior to installing a new filter moisten the filter seal with fresh and clean engine oil.
- Screw on the filter manually until the seal is in contact with the oil filter adapter. Continue turning by another 1/3 ... 3/4 turns.
- Start the engine and let it IDLE to check whether there is oil leaking. Switch off the engine, check the oil level and top up oil if necessary.
- Dispose of the used oil filter properly.

Oil cooler

After long periods of operation the cooling system can be obstructed with dust or plant particles. Continuous operation with an obstructed cooling system causes the engine to overheat, and can damage the engine.

- Check the oil cooler (C/22) continuously. Using brush or compressed air, remove dirt and plant debris if necessary.
Sparking plugs

⚠️ Persons with cardiac pacemakers are not allowed to touch the energized parts of the ignition system as long as the engine is running.

After every 50 operating hours:
- Using a wire brush (B), remove the soot deposits from the sparking plug electrodes.
- Check the electrode gap. Adjust it to 0.76 mm.

Replace the sparking plugs after approximately 100 operating hours.

Fuel hoses

Replace every 2 years. Replace leaking plastic hoses immediately.

Fuel filter

Replace the fuel filter (C/9) annually. Note flow direction!

Cyclone air filter

- After every 25 operating hours, carefully tap on one end of the air filter insert to clean it. Wash and dry the filter cover. Never blow out the insert with compressed air. Never wash or oil it.
- Replace the air filter insert after 3 x knocking out and, at the latest, after 100 operating hours, or when the insert is damaged.
- Prior to each startup squeeze the dust removal valve to empty the air filter preseparator.
Air cooling system

After long periods of operation, the cooling system can be obstructed with dust or plant particles. Continuous operation with an obstructed cooling system causes the engine to overheat, and can damage the engine.

Never spray water on the engine. Use a brush or compressed air.

- Continually check the **fan grille** (C/5), and remove aspirated dirt and plant debris.

Dirt particles in the fan cowl can be removed from below through the membrane opening (M).

- Remove the **fan housing** every 100 operating hours or **at least yearly**, ideally before the season. Clean the cooling fins on cylinder and cylinder head, the fan, the oil cooler, and the deflector plates that are necessary for air circulation.

- **agria-Service** -
Handle hot engine components with caution!
The silencer and other engine parts get very hot when the engine is running and are still hot directly after the engine is switched off. Keep a sufficient distance from hot surfaces and keep children away from the running engine.

Exhaust system and speed governor

Regularly check the exhaust system (C/18), governor lever, linkage and governor springs for contamination and plant debris. Clean with a brush or compressed air if necessary. **Danger of fire - due to contaminated exhaust system!**
Check before each start-up.
Replace damaged exhaust parts.

Carburettor adjustments

Adjusting the valve play

Idle speed

Always ensure that the engine idle speed is adjusted correctly. With speed regulating lever at idling, the engine should continue running smoothly.

- agria-Service -
Battery

Observe the instructions of the battery manufacturer!

Charging:
- Only use suitable DC chargers.
- For recharging use a charger with a constant charging voltage of 14.4 V.
- Ensure good room ventilation.
- Remove the battery from the machine. Disconnect the battery poles, starting at the negative terminal.
- Connect the positive terminal of the battery to the positive output of the charger, and likewise for the negative connection.
- Switch on the charger only after you have connected the battery.
- Recommended charging current: 1/10 A of battery capacity Ah.
- Interrupt charging, if the acid temperature exceeds 45 °C.
- The battery is fully charged when the charging voltage has not increased in 2 hours.

Maintenance
- Keep the battery clean and dry
- Only wipe the battery with a damp cloth, as otherwise there is a danger of explosion
- Do not open the battery
- Check the battery condition at least every 50 operating hours

⚠️ Never leave the battery discharged! Avoid sparks and open flames near batteries. Caution when handling battery acid - caustic! Only use specified fuses. Using incorrectly dimensioned fuses destroys the electrical system – Risk of fire!

Putting the battery out of service
- Charge battery, store it at a cool place, and disconnect the negative terminal from the machine.
- Check the battery charge at regular intervals. Recharge if necessary.

Disposal
- Deliver used batteries to a collecting point (to prevent acid from escaping, store and transport them in an upright position and protected against tipping).
- Never dispose of batteries in domestic waste!
Machine

Gearbox

The hydraulic oil in the gearbox has the same specification as the engine oil. When you change to hydraulic bio-oil, drain the previously used oil and purge twice.

Allow the gearbox to cool down before you start maintenance work. The temperature during maintenance work should not be higher than 51°C.

1. Check the gearbox oil level before each startup and after every 25 operating hours - oil-filling orifice (A/1).
   - Wipe the filling orifice with a clean cloth, and screw out the filling plug.
   - When the machine is in a horizontal position, the oil level must be at the level of the filling hole. Top up gearbox oil if necessary.

2. Change the gearbox oil after the first 50 operating hours and then after every 200 operating hours.
   - Tilt the machine forward on the connecting flange.
   - Unscrew the oil filter (5) and replace it.Moisten the sealing ring of a new filter with oil.
   - Dispose of the used oil filter properly.

3. Change the gearbox oil and the oil filter after the first 50 operating hours, and afterwards every 600 operating hours when the oil is at operating temperature.
   - Thoroughly clean oil filler plug (1) and oil drain plug (4) and their environment to prevent dirt from getting into the gearbox.
   - Open the drain plug, collect the used oil in a suitable container, and dispose of it properly.
   - Clean the drain plug. It is equipped with a magnetic core that attracts metallic particles.
   - Check the sealing rings (2) and (3). Replace them if necessary.
   - Screw in and tighten the drain plug with sealing ring.
   - Fill in fresh gearbox oil up to the filling hole (machine in horizontal position).
   - Oil filling volume and oil grade see "Technical data".
   - Close the filling hole with the screw plug.
Hydraulic oil cooler (only 22 hp)

After long periods of operation, the cooling system can be obstructed with dust or plant particles. Continuous operation with an obstructed cooling system causes the gearbox to overheat, and can damage the gearbox.

Check the oil cooler (C/21) before startup. Using brush or compressed air, remove dirt and plant debris if necessary.

Hydraulic hoses

- Check for leaks, damage and ageing after 200 operating hours, at least yearly.
- Replace hydraulic hoses after 6 years. Use only new (not older than 2 years) genuine Agria hydraulic hoses.

⚠️ High-pressurized hydraulic oil can penetrate your skin and cause severe injuries. Danger to life!

To avoid injuries, use suitable devices when you try to locate leaks - specialized workshop!

Brake

- Check smooth operation and efficiency of brake pads and brake actuation after every 200 operating hours or at least yearly.
  - agria-Service -

Wheel motors

- Check for straightline driving at steering bar neutral position every 200 operating hours.
  - agria-Service -
Bar latching pin

Lubricate the lubricating nipple of the bar latching pin every now and then with bio lubricating grease, at least **yearly** and after each cleaning with a high-pressure cleaner.

Steering bar lock

After every **200** operating hours and after each cleaning with a high-pressure cleaner coat at both sides the bar lock rolls (A/8) for the bar rollers with some bio lubricating grease.

Steering valve

After every **min. 100** operating hours and after each cleaning with a high-pressure cleaner coat at both sides the sliding surfaces of the adjusting plate on the steering valve with some bio lubricating grease.

Steering bar ultra bushings

- After every **200** operating hours, check function and firm seating of the ultra bushings in the steering tower (vibration-damped steering bar bearing).

- **agria-Service** -
5 Maintenance and Repair

Steering bar centre screw

- After every 200 operating hours, check the steering bar centre screw (A/9). The steering bar should rest on the steering tower without any play, but still easily rotatable. Grease the rotating/sliding surface as necessary.

- agria-Service -

Loading strap

Check for damage before each use and during each maintenance work. Replace if necessary. Replace after 10 years at the latest.

Driving wheels

- During initial startup and after each wheel change, check and tighten the wheel bolts or wheel nuts after the first 2 operating hours and then during each service work and after every 50 operating hours with 100 Nm.

- Check the tyre pressure of the wheels frequently. For smooth driving ensure that the tyre pressure in both wheels is the same. Never exceed the maximum tyre pressure!

The max. tyre pressure is shown on the side of the tyre.

⚠️ There is a risk of explosion from excessive tyre pressure.

Only skilled specialists are allowed to repair and change tyres, using suitable installation tools.
Wheel hubs

- Tighten the hexagonal nuts (A/26) for the wheel hubs at both sides with 250 Nm after every 50 operating hours.

Safety circuit

Check the function of the safety circuit before each startup and during each maintenance work.

- Traction and PTO shaft drive must stop automatically when you release the safety lever (B/4)

The traction drive is switched off electrically via the safety valve on the steering valve.

- Check the electrical cables, switches and connections. Replace if necessary.
- agria-Service -

The PTO shaft is switched off with Bowden cable and compression spring via the gate lever.

- When the safety lever (B/4) is pressed down, the pin (Y) must be in contact with the switching arm at the top in the gate (W). Adjustment is made at the Bowden cable adjusting screw (Z).
- agria-Service -
Switch in the safety lever
To function, the switch requires the plunger of the switch to be pressed in by $X = 1 \ldots 1.5$ mm when the safety lever is actuated.

- agria-Service -

Engine stop circuit

Check the function of the motor stop circuit before each startup and during each maintenance work.

- The engine must stop when the ignition key (B/12) is in "O" position.
- Check the electrical cables and connections. Replace if necessary.

- agria-Service -
Check play/adjustment before each startup. Readjust if necessary (in particular during the running-in period after initial startup and after the clutch lining has been replaced).

**Clutch:**

$X = 1 \ldots 2 \text{ mm (clutch play)}$

! = Bowden cable in hand lever bearing inserted in *down* position.

**Adjustment**

1. Remove shaped spring (2) and remove the cable pull end (3) with the adjusting pin (4) from the retainer in the hand lever.

2. Screw the adjusting pin in / out until there is a distance "X" or idling at position 0.

3. Reinsert the cable pull end with the adjusting pin in the retainer and install the shaped spring (2).
Labels
Replace worn-out and missing signs for operating and safety instructions.

1 75750 clutch
2 79441 PTO shaft
3 79427 warning icon set
4 79426 warning icons for hot parts
5 69883 choke
6 75755 speed

8 79439 easy-control
9 79440 steering
10 79443 brake
11 79444 bypass
5 Maintenance and Repair

General

Before each start-up check for escaping fuel and oil and eliminate the cause.

- agria-Service -

Regularly check nuts and bolts for tightness and retighten if necessary.

At least yearly and after cleaning:

Lubricate all sliding or moving parts (such as speed regulating lever, hand lever bearing, etc.) with bio lubricating grease or bio lubricating oil.

Cleaning

Machine

Clean thoroughly with water immediately after each use.

Never expose electrical cables and components (switches, easy-control control unit, safety valve, control module) to a direct water jet.

At the end, lubricate all sliding parts with bio-based lubricating oil or with bio-based lubricating grease.

In addition lubricate the lubrication points on the machine immediately after cleaning with a high pressure cleaner, and put the machine briefly into operation to press out the penetrated water.

To protect the bearings against penetrating dirt, sap and water, there shall be a grease collar at the bearing points.

Engine

Only clean the engine with a cloth. Do not spray with water, as water could enter the ignition and fuel system and cause malfunctions.
Storage

If the machine is out of operation for an extended period:

(1) **Clean.** Touch up the paint.
(2) Spray all **bare parts** and mower head with bio corrosion-inhibiting oil.
(3) **Preserve the engine.**

**Petrol engine**

- Completely drain the fuel outdoors into a suitable container.

⚠️ **Petrol is highly flammable and explosive under certain conditions!** Never smoke in the working area. Stay away from naked flames and sparks.

**Alternatively** fill the fuel tank completely and add a fuel stabilizer (Agria no. 799 09) to the fuel.

- **Observe the operation instructions!** Let the engine run for approximately 10 minutes.

- Change engine oil.
- Fill a teaspoon (approximately 0.03 l) of engine oil into the sparking-plug hole. Slowly crank the engine.
- Reinstall the sparking plug and set the piston with the cable-pull starter to compression (slowly pull at the starter handle until you can feel resistance). The valves are now closed.
- Slowly crank the engine every 2...3 weeks (sparking-plug connector removed!) and set the piston back to compression.
(4) **Driving wheels**
Jack up the machine such that the wheels are not on the ground. A flat pneumatic tyre is unserviceable within a very short time when it is under load on the ground.

(5) **Clutch**
Park the machine always with applied manual clutch lever (stop pawl engaged). Failure to do so can cause clutch problems due to corrosion.

(6) **Shelter the machine**
To avoid heavy corrosion:
- Protect against weather influence
- Do not store in
  - damp rooms
  - synthetic fertiliser stores
  - stables and adjacent rooms

(7) **Cover the machine**
Cover the machine with a cloth or something similar
6 Troubleshooting and Remedies

⚠️ Observe the safety instructions! Faults on the machine or on the engine that make a major intervention necessary must always be repaired by a specialist agria workshop that have the necessary tools. Incorrect intervention will only lead to damage.

7 Decommissioning / Disposal

If the machine will not be further used, it must be correctly decommissioned.

⚠ To avoid injuries during decommissioning, park the machine in a stable position and protect it against tipping over and rolling away.

⚠️ Wear protective gloves.

After decommissioning, the remaining fuel and oil must be drained and disposed of in a correct and environmentally compatible manner.

♻️ The machine consists of valuable raw materials, which can be recycled and reused.

Take the machine including the remaining technical fluids to a recycling facility for disposal.

⚠️ Dispose of old batteries and electrical/electronic parts in accordance with the applicable legal provisions. Do not dispose of as domestic waste.

9. Hydraulic hose left A
10. Hydraulic hose right A
11. Hydraulic hose right B
12. Oil cooler
Hydraulic hoses

Connection  A  = hydraulic hose
Connection  B  = hydraulic hose

Check for leaks, damage and ageing after 200 operating hours, at least yearly. Replace hydraulic hoses after 6 years. Use only new (not older than 2 years) genuine Agria hydraulic hoses.

⚠️ High-pressurized hydraulic oil can penetrate your skin and cause severe injuries. Danger to life!

To avoid injuries, use suitable devices when you try to locate leaks - specialized workshop!

Declaration of Conformity

EG-Konformitätserklärung
EC Declaration of Conformity

Wir erklären, dass das Produkt
mit allen einschlägigen Bestimmungen der EG-Maschinenrichtlinie 2006/42/EG in Übereinstimmung ist. Die Maschine ist auch in Übereinstimmung mit allen einschlägigen Bestimmungen der folgenden EG-Richtlinie:

2004/108/EG

Nouss déclarons que le produit
est conforme à toutes les exigences respectives selon la directive relative aux machines 2006/42/CE. La machine est aussi conforme à toutes les exigences respectives selon la directive CE suivante:

2004/108/CE

We herewith declare that the product
conforms to all relevant specifications of the Directive on Machinery 2006/42/EC. It is also conform to all relevant specifications of following EC directive:

2004/108/EC

Wij verklaren dat het product
voldoet aan de desbetreffende bepalingen van de EG-machinerichtlijn 2006/42/EG. De machine voldoet ook aan de desbetreffende bepalingen van het volgende EG-richtlijn:

2004/108/EG

Folgende harmonisierte Normen (oder Teile davon) oder techn. Spezifikationen wurden angewendet:

Les normes harmonisées (ou extraits de celles ci) ou les spécifications techniques suivantes ont été appliquées:
